TEWS TECHNOLOGIES GmbH has made any effort to ensure that this manual is accurate and complete. However TEWS TECHNOLOGIES GmbH reserves the right to change the product described in this document at any time without notice.

TEWS TECHNOLOGIES GmbH is not liable for any damage arising out of the application or use of the device described herein.

**Style Conventions**

Hexadecimal characters are specified with prefix 0x, i.e. 0x029E (that means hexadecimal value 029E).

For signals on hardware products, an 'Active Low' is represented by the signal name with # following, i.e. IP\_RESET#.

Access terms are described as:

W	Write Only
R	Read Only
R/W	Read/Write
R/C	Read/Clear
R/S	Read/Set

# 1 Product Description

The TPMC671 is a standard single-width 32 bit PMC with 16 24V digital inputs galvanically isolated from the computer system by optocoupler. The inputs are also potential free to each other. A high performance input circuit ensures a defined switching point and polarization protection against confusing the pole.

All inputs have a common electronic debounce circuit with a freely programmable debounce time.

All inputs can generate an interrupt. The signal edge handling is programmable to interrupt on rising, falling or both edges of the input signal.

The TPMC671 has 16 digital high side or low side switches (build option) with galvanic isolation from the computer system by optocoupler. The outputs are also isolated against each other in groups of four outputs. All outputs are protected against short-circuit and thermal overload. The output drivers are capable of driving 0.5A continuous per channel.

A hardware watchdog clears all outputs in case of trigger fail. The TPMC671-1xR provides front panel I/O, the TPMC671-2xR provides P14 I/O.

## 3 Functional Description

### 3.1 Digital Outputs

#### 3.1.1 Optical Isolation

The TPMC671 has 16 high side switch (TPMC671-10R/20R) or 16 low side switch (TPMC671-11/21) digital outputs. The standard signal level for these outputs is 24 V DC. All outputs are isolated by optocouplers from the computer system and are also isolated against each other in groups of four outputs.

GROUP	VS / standard 24V DC	GROUND	OUTPUT
O1	VS_O1	GND_O1	OUT 1 OUT 2 OUT 3 OUT 4
O2	VS_O2	GND_O2	OUT 5 OUT 6 OUT 7 OUT 8
O3	VS_O3	GND_O3	OUT 9 OUT 10 OUT 11 OUT 12
O4	VS_O4	GND_O4	OUT 13 OUT 14 OUT 15 OUT 16

Table 3-1 : Isolated Digital Outputs

#### 3.1.2 Output Polarity

Each output can be individually switched to the according power supply VS\_Ox (high side switch) or GND\_Ox (low side switch).

#### 3.1.3 Overload Protection

The output drivers used on the TPMC671 are smart drivers TDE1707. The maximum continuous output current is 0.5 A. The output circuits are protected against overload, short circuit and over temperature. In case of such a failure the corresponding output is switched off until the error condition is removed. Then the output returns automatically to normal operation and the state programmed in the Data Output Register.

For details about the protection of the TDE1707 please refer to the data sheet, available at <http://www.st.com>.

### 3.1.4 Output Watchdog

Writing '1' into bit 1 of the Global Control Register and the following first write access to the Data Output Register enables the hardware watchdog function. The status of the watchdog is indicated at the bit 3 of Global Control Register.

Any software access (read or write) to the Data Output Register of the TPMC671 will retrigger the watchdog. The maximum time between two accesses is set to 120 ms, if the time expires without a software access all outputs go into the 'OFF' state. At the same time the watchdog status will change from '0' to '1' and lock the Data Output Register. This prevents a write access to the Data Output Register.

Writing '1' to the watchdog status (Bit 3 Control Register) clears this bit and also unlocks the Output Register. After unlocking the Data Output Register the outputs stay in the 'OFF' state till the next write access to this register.

**The watchdog is disabled after power-on or reset.**

## 3.2 Digital Inputs

### 3.2.1 Optical Isolation

The TPMC671 has 16 digital inputs. The standard signal level for these inputs is 24 V DC. The switching level of the inputs is between 7.5 V and 14 V. All inputs are isolated by optocouplers from the computer system and are also isolated against each other.

### 3.2.2 Debounce Function

A programmable debounce function common for all inputs is implemented on the TPMC671. There is only one debounce time adjustable for all 16 (TPMC671-10R/20R) or 8 (TPMC671-11R/21R) digital inputs.

If the debounce function is enabled, the input pin must be static for the programmed debounce time before the rising or falling edge is recognized as valid. Thus, only after a correct identification the Data Input Register is updated and an interrupt is generated.

**The debounce function is disabled after power-on and reset. The debounce time is set to value '0' after power-on and reset.**

### 3.2.3 Interrupt Logic

Interrupt generation can be individually programmed for each channel and input transition. To enable the interrupt after a reset, the Global Interrupt Enable bit in the Control Register must be set to the value '1'. Also the respective bit for rising or falling edge in the Rising Edge / Falling Edge Interrupt Enable Registers must be set.

**The Global Interrupt Enable and also all individually interrupt enable bits are disabled after power-on and reset.**

## 4.2 Base Address Register Configuration

The TPMC671 maps its internal registers into an address spaces within the PCI I/O space.

For backward compatibility a subset of PCI9030 registers have been implemented. This subset contains all registers that are used by the standard TEWS module driver. They can be accessed both in memory and I/O space.

Base Address Register (BAR)	PCI Space Mapping	Size (Byte)	Port Width (Bit)	Endian Mode	Description
0	MEM	128	32	LIT	Configuration Register Space
1	IO	128	32	LIT	
2	IO	16	16	BIG	Local Register Space

## 5.2 Local Register Space

### 5.2.1 Data Output Register

The Data Output Register is a word wide read/write register that is used to set or clear the different outputs of the TPMC671.

Bit	Symbol	Description	Access	Reset Value
15	OUTPUT16	To set an output line active, write '1' to the corresponding bit. For the inactive state write '0' to the corresponding bit.  0 : inactive 1 : active  Bit 0 represents output line 1 and bit 15 represents output line 16. After power-on or reset the Data Output Register is cleared to '0', all outputs are inactive.	R/W	0x0000
14	OUTPUT15			
13	OUTPUT14			
12	OUTPUT13			
11	OUTPUT12			
10	OUTPUT11			
9	OUTPUT10			
8	OUTPUT9

5	INPUT6			
4	INPUT5			
3	INPUT4			
2	INPUT3			
1	INPUT2			
0	INPUT1			

Table 5-7 : Data Input Register

## 5.2.3 Control / Status Register

The Control / Status Register is a read/write register.

Bit	Symbol	Description	Access	Reset Value
15 : 4	-	Not used and undefined during reads	-	-
3	WD_STA	Watchdog Status Flag 1 = indicates that the watchdog had recognized a failure and had disabled all output channels. Also the Output Register is locked. Writing '1' to this bit unlocks the Output Register. 0 = signals normal operation	R/W	0
2	DB_ENA	Debounce Enable 1 = enables the debounce function for all 16 inputs 0 = disables debounce function	R/W	0
1	WD_ENA	Watchdog Enable 1 = enables watchdog for all 16 outputs 0 = disables watchdog function	R/W	0
0	INT_ENA	Global Interrupt Enable 1 = globally enables interrupt for all 16 inputs 0 = globally disables interrupts The input channels generate interrupts at pin INTA# of the PCI bus.	R/W	0

Table 5-8 : Control / Status Register

**The watchdog status is only active if the watchdog is enabled.**

## 5.2.4 Rising Edge Interrupt Enable Register

The Rising Edge Interrupt Enable Register is a word wide read/write register.

Bit	Symbol	Description	Access	Reset Value
15	INT_ENA_H16	0 : Interrupt for input line disabled 1 : Interrupt for input line enabled  Bit 0 of the Rising Edge Interrupt Enable Register enables the interrupt of input line 1 for the rising edge. Bit 15 enables interrupt of input line 16 for rising edge. All other bits are equivalent.	R/W	0x0000
14	INT_ENA_H15			
13	INT_ENA_H14			
12	INT_ENA_H13			
11	INT_ENA_H12

0	INT_ENA_H1			

Table 5-9 : Rising Edge Interrupt Enable Register

## 5.2.5 Falling Edge Interrupt Enable Register

The Falling Edge Interrupt Enable Register is a word wide read/write register.

Bit	Symbol	Description	Access	Reset Value
15	INT_ENA_L16	0 : Interrupt for input line disabled 1 : Interrupt for input line enabled  Bit 0 of the Falling Edge Interrupt Enable Register enables the interrupt of input line 1 for the falling edge. Bit 15 enables interrupt of input line 16 for falling edge. All other bits are equivalent.	R/W	0x0000
14	INT_ENA_L15			
13	INT_ENA_L14			
12	INT_ENA_L13

Table 5-11: Rising Edge Interrupt Status Register

## 5.2.7 Falling Edge Interrupt Status Register

The Falling Edge Interrupt Status Register is a word wide read/write register.

Bit	Symbol	Description	Access	Reset Value
15	INT_STA_L16	<p>Read access: 0 = no interrupt request pending 1 = interrupt request pending</p> <p>Write access: 0 = no effect 1 = clear pending interrupt request</p> <p>Bit 0 of this register reflects the interrupt request state of input line 1 for the falling edge, bit 15 reflects the interrupt request state of input line 16 for the falling edge. An interrupt request for a specific input line is cleared by writing '1' to the according bit of the Falling Edge Interrupt Status Register.</p>	R/W	0x0000

0	INT_STA_L1			

Table 5-12: Falling Edge Interrupt Status Register

## 5.2.8 Debounce Time Register

The Debounce Time Register is a word wide read/write register.

Bit	Symbol	Description	Access	Reset Value
15	DB_TIME	<p>The debounce time could be programmed by writing a hexadecimal value in the register.</p> <p>One hexadecimal step correspondence to a debounce time of about 7 <math>\mu</math>s.</p> <p>min debounce time: 7 <math>\mu</math>s max debounce time: 440 ms debounce step: ca. 7 <math>\mu</math>s</p> <p>The value 0 in this register sets the debounce time to a minimum of 7<math>\mu</math>s. This is the default state after power-on or reset. Any debounce time in the range of 7 <math>\mu</math>s to 440 ms can be programmed in steps of ca. 7 <math>\mu</math>s. The debounce time is common for all 16 inputs.</p>	R/W	0x0000

Table 5-13: Debounce Time Register

**To use the programmable debounce time, the Debounce Enable Bit of the Control / Status Register must be set to '1'.**

**If the Debounce Enable Bit of the Control / Status Register is set to '0', no debounce function is active for all inputs.**

The following formulas can be used to determine the preload value.

$$t_{db} = (Z + 1) \cdot \frac{64}{PCICLK} \cdot 3.5$$

$$Z = \frac{t_{db}}{64 \cdot 3.5} \cdot PCICLK - 1$$

$$t_{max} = (Z + 1) \cdot \frac{64}{PCICLK} \cdot 4$$

$$t_{min} = (Z + 1) \cdot \frac{64}{PCICLK} \cdot 3$$

$t_{db}$	- typical debounce time [ s ]
Z	- preload value
PCICLK	- 33.33 MHz
$t_{max}$	- max. debounce time [ s ]
$t_{min}$	- min. debounce time [ s ]

Figure 5-1: Formulas to determine preload value

# 6 Configuration Hints

## 6.1 Big / Little Endian

- PCI – Bus ( Little Endian )

Byte 0	AD[7..0]
Byte 1	AD[15..8]
Byte 2	AD[23..16]
Byte 3	AD[31..24]

- Every Local Address Space (0...3) and the Expansion ROM Space can programmed to operate in Big or Little Endian Mode.

Big Endian		Little Endian	
<b>32 Bit</b>		<b>32 Bit</b>	
Byte 0	D[31..24]	Byte 0	D[7..0]
Byte 1	D[23..16]	Byte 1	D[15..8]
Byte 2	D[15..8]	Byte 2	D[23..16]
Byte 3	D[7..0]	Byte 3	D[31..24]
<b>16 Bit upper lane</b>		<b>16 Bit</b>	
Byte 0	D[31..24]	Byte 0	D[7..0]
Byte 1	D[23..16]	Byte 1	D[15..8]
<b>16 Bit lower lane</b>			
Byte 0	D[15..8]		
Byte 1	D[7..0]		
<b>8 Bit upper lane</b>		<b>8 Bit</b>	
Byte 0	D[31..24]	Byte 0	D[7..0]
<b>8 Bit lower lane</b>			
Byte 0	D[7..0]		

Table 6-1 : Local Bus Little/Big Endian

## 6.2 Local Software Reset

A local reset is used to reset the on board local logic.

The local reset is active during PCI reset or if the PCI Adapter Software Reset bit is set in the local configuration register CNTRL (offset 0x50).

### **CNTRL[30] PCI Adapter Software Reset:**

Value of 1 resets the on board local logic. It remains in this reset condition until the PCI Host clears this bit. The contents of the PCI Configuration Registers are not reset. The PCI Interface is not reset.

## 6.3 Configuration EEPROM

For backward compatibility the serial EEPROM contains the configuration data of the previous version's PCI controller.

Address	Offset							
	0x00	0x02	0x04	0x06	0x08	0x0A	0x0C	0x0E
0x00	0x029F	0x1498	0x0280	0x0000	0x1180	0x0000	s.b.	0x1498
